Configuring the Dark Reader

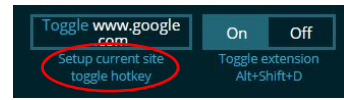

1. Shortcuts

These buttons enable/disable the extension completely or per web site. Pressing them in the configuration menu has the same effect as the shortcuts. Alt + Shift + D turns the extension completely on or off.

Users can change these shortcuts by selecting the "Setup current site toggle hotkey," which will display the menu displayed to the right.

Selecting these boxes allows the user to configure custom shortcuts for the four functions listed.

Shortcuts are not permanent and can be changed by selecting the same text in the configuration menu.

2. Style

This extension allows for configuration of each value used to display objects on the internet.

Dark/Light – enables element inversion

Brightness – adds or subtracts while from elements

Contrast – alters difference between colors

Sepia – adds a red/brown hue

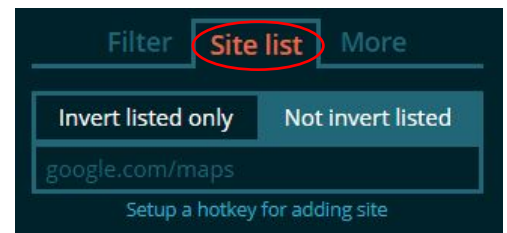

Grayscale – increases the range between white and black

Each of these properties can be configured individually using the arrows on either side of the value.

3. Site List

The Dark Reader allows for all configuration rules to be applied to single sites. This means one can keep specific sites unedited while still using the extension. To add a site to the not inverted section, type the site URL into the text box. This can be useful for keeping websites with dark elements from becoming light.

4. Themes

Sometimes elements on a webpage are not inverted correctly. The Dark reader uses multiple themes to correct this. Each theme inverts elements in a different way.

Filter and Filter+ are simple themes, taking every element on the page and inverting them. This can lead to saturation of colors, making images look undesirable.

Static is the only theme with its own sub menu, allowing users to manually configure page elements. This process is time consuming and requires experience with HTML.

Dynamic is the most popular theme.
